1.Install the free version of Spybot Search & Destroy or Malwarebytes Antispyware on your Windows PC and run a full system scan; take a screenshot of the scan results showing any detected spyware or a clean report.

2.Research and list 5 common signs that your device might be infected with spyware, using examples from real-world news articles or recent tech blogs about popular apps or devices in India.

3.Simulate a browser spyware scenario: create a simple HTML page with a fake 'Login with Instagram' button, and use JavaScript to log any keystrokes entered into a password field to the console.

Hint: Use the oninput event on the password field to capture and display keystrokes.

```
<!DOCTYPE html>
<html>
<head>
  <title>Spyware Demo</title>
</head>
<body>
  <h2>Browser Spyware Demo</h2>
  <p>Educational test only</p>

  <button type="button">
    Login with Instagram (Demo)
  </button>

  <p>Enter Dummy Password:</p>
  <input type="password" id="password"
      oninput="showInput()">

  <script>
    function showInput() {
      let password =
        document.getElementById("password");
```

```
        console.log(
          "Password field changed. Length:",
          password.value.length
        );
      }
  </script>
</body>
</html>
```

```
Password field changed. Length: 1
Password field changed. Length: 2
Password field changed. Length: 3
Password field changed. Length: 4
```

4.Compare the features of two popular antispyware tools (such as Windows Defender and Malwarebytes) by making a table that covers detection methods, real-time protection, update frequency, and user interface.

Feature	**Windows Defender (Microsoft Defender)**	**Malwarebytes (Free Version)**
Detection Methods	Uses signature database and heuristic analysis (behavior-based detection) to identify viruses and spyware.	Uses advanced behavioral monitoring and modern malware signature databases.
Real-Time Protection	**Yes (✅)** — Runs continuously in the background to detect and block threats automatically.	**No (❌)** — Real-time protection is not included in the free version (manual scans only; available in Paid version).

Feature	Windows Defender (Microsoft Defender)	Malwarebytes (Free Version)
Update Frequency	Updates automatically alongside regular Windows OS updates.	Updates virus definitions manually or automatically via the app.
User Interface	Built directly into Windows Security settings with a clean, simple layout.	Features a dedicated, standalone dashboard that is easy to navigate.

5.Use ChatGPT to generate a checklist of at least 7 best practices for preventing spyware infections on smartphones, then pick 2 and explain how you would implement them on your own device.

- **Download Apps Only from Official Stores**
- Always download apps from official sources like Google Play Store or Apple App Store. Avoid downloading third-party APKs or sideloading apps from unknown websites.
- **Keep Your Operating System and Apps Updated**
- Turn on automatic updates for your OS and apps so your phone always gets the latest security patches.
- **Carefully Review App Permissions**
- Check app permissions regularly. Revoke permissions for sensitive features (camera, microphone, location, contacts) if an app doesn't need them to function.
- **Beware of Suspicious Links & Emails (Phishing)**
- Avoid clicking on unknown links sent via SMS, WhatsApp, or emails. Phishing links are a primary vector for installing spyware.
- **Enable Two-Factor Authentication (2FA)**
- Activate 2FA across all your personal and social media accounts to prevent unauthorized access even if your credentials are leaked.
- **Avoid Public Wi-Fi Networks Without a VPN**

- Avoid connecting to unverified, open public Wi-Fi networks. If you must use them, connect through a Virtual Private Network (VPN) to encrypt your traffic.
- **Delete Unused Apps Regularly**
- Remove old or unused applications from your phone to reduce the attack surface and prevent outdated apps from causing vulnerabilities.

Practice 1: Keep OS & Apps Updated

- **How to implement on Android:**
    1. Open **Settings** > **System** > **Software Update**.
    2. Enable **Auto-download over Wi-Fi**.
    3. Open **Google Play Store**, tap your profile icon > **Settings** > **Network preferences** > **Auto-update apps**.
- **How to implement on iPhone (iOS):**
    1. Open **Settings** > **General** > **Software Update**.
    2. Tap **Automatic Updates** and toggle on both **Download iOS Updates** and **Install iOS Updates**.

Practice 2: Review & Manage App Permissions

- **How to implement on Android:**
    1. Open **Settings** > **Apps** > **Permission Manager**.
    2. Select sensitive categories like **Camera**, **Microphone**, or **Location**.
    3. Review the list and change unnecessary apps to *"Allow only while using the app"* or *"Don't allow"*.
- **How to implement on iPhone (iOS):**
    1. Open **Settings** > **Privacy & Security**.
    2. Select **Camera**, **Microphone**, or **Location Services**.
    3. Turn off access for any app that doesn't strictly need it.
