**1.Choose any one popular app you use (like Instagram, Zomato, or Paytm), research a real malware incident that has affected a similar app or platform, and write a brief summary of how the malware worked and what damage it caused.**

App Selected: Instagram

Malware Name: Android Marcher Malware

Incident: Android Marcher was a real banking malware that also used fake login screens for popular apps, including Instagram.

How Malware Worked:

1. Users installed a malicious Android app.
2. Malware displayed a fake Instagram login screen.
3. Users entered their username and password.
4. Malware stole the login details and sent them to attackers.

Damage Caused:

- Instagram accounts could be hacked.
- Personal information could be stolen.
- Attackers could misuse stolen passwords.
- Users could lose access to their accounts.

**2.Identify at least 3 Indicators of Compromise (IoCs) that could be used to detect the malware you researched, such as suspicious file hashes, IP addresses, domain names, or unusual app behaviors, and list them in your report.**

| No. | IoC | Description |
|---|---|---|
| 1 | Fake login screen | Instagram login appears unexpectedly. |
| 2 | Suspicious app permissions | Unknown app requests unnecessary permissions. |
| 3 | Unknown network connections | App sends data to suspicious servers. |

**3.Suggest 2-3 mitigation steps that app developers or users could take to prevent or reduce the impact of this type of malware, and explain why each step is effective.<br><br>Hint: Think about security updates, permissions, user education, or app store policies.**

1. Install Apps from Trusted Sources

Download apps from the Google Play Store or official sources. This reduces the risk of installing malware.

2. Update Apps Regularly

Install security updates to fix vulnerabilities and protect your device.

3. Enable Two-Factor Authentication (2FA)

2FA adds extra security. Even if a password is stolen, it can help prevent unauthorized login.

**4.Review a classmate's malware analysis report and write a short peer review highlighting one strength and one area for improvement in their findings or recommendations.**

Strength:

My classmate explained how malware works in simple language. The report also included useful security tips.

Area for Improvement:

My classmate should add more IoCs and real examples to improve the report.

**5.Prepare a 2-minute verbal summary of your malware report and present it to your group, then answer at least one follow-up question from your peers or instructor.**

Good morning everyone.

Today, I am going to explain my malware analysis report.

I selected Instagram as my app and Android Marcher as the malware.

Android Marcher is a dangerous malware that targets Android users. It can display fake login screens to steal personal information.

This malware can steal passwords and other sensitive data. Attackers can use this information to access user accounts.

We can identify suspicious activity by checking fake login screens, unusual permissions, and unknown network connections.

To protect ourselves, we should download apps from trusted sources, update our apps regularly, and enable two-factor authentication.

In conclusion, we should be careful while using mobile apps and never share our passwords with unknown sources.

Thank you.
